Assume a learning rate (η) of 0.72 and discount factor (γ) of 0.81, what will be updated values adopting TD-based state value update with each move. Assume all rewards are -1 except for the actions leading to the goal

state with respect to X-player.

Answer:

$$v(t) = v(t) + \eta * (r + \gamma * v(t+1) - v(t))$$
